

# [Active Web page for editing with any browser]

## Abstract of Disclosure

A method for creating and editing Web pages using a browser on a personal computer with no additional resident program. Selected HTML element tags and content controlled by the tags are stored separately in a data stores. A Web server returns a requested HTML page from the data stores and renders the selected HTML element tags and content usually consisting of text, hypertext links, graphics, sounds, and hypermedia links. Each tag's content is individually wrapped in " *hyperedit* "links making the entire visible document active. Each *hyperedit* link invokes an edit window with input boxes containing the selected HTML tag, its attributes, and content respectively. The user changes any or all the entries and invokes a button to update the data stores values.
